11.3: Symptoms of exposure

See section 4.2

11.4: Delayed and immediate effects of esposure

Lithium and its compounds are possible teratogens by analogy to lithium carbonate which has equivocal human teratogenic data and positive animal teratogenic data.

Inorganic bromides may lead to depression, emaciation and in severe cases psychosis and severe mental deterioration. Bromoderma, a bromine rash, often occurs from prolonged exposure and usually occurs on the face resembling acne or furnuclosis.

Large doses of lithium ion have caused dizziness and prostration, and can cause kidney damage if sodium intake is limited. Dehydration, weight loss, dermatological effects, and thyroid disturbances have been reported. Central nervous system effects that include slurred speech, blurred vision, sensory loss, ataxia, and convulsions may occur. Diarrhea, vomiting, and neuromuscular effects such as tremor, clonus, and hyperactive reflexes may occur as a result of repeated exposure to lithium ion.,

To the best of our knowledge the toxicological properties have not been thoroughly investigated.
